The Quality of the *KombiFiD*-Sample of Enterprises from Manufacturing Industries: Evidence from a Replication Study*

*Joachim Wagner***

Abstract:

Diese Untersuchung prüft ob die KombiFiD-Zustimmungsstichprobe als ein Datensatz von hoher Qualität für empirische Untersuchungen zu Industrieunternehmen gelten kann. In einem ersten Schritt wird eine Untersuchung mit den Originaldaten aus Erhebungen der amtlichen Statistik durchgeführt. Diese Untersuchung wird dann in einem zweiten Schritt exakt mit den Daten der KombiFiD-Zustimmungsstichprobe repliziert. Für Westdeutschland zeigt ein Vergleich der Ergebnisse mit Originaldaten und KombiFiD-Daten im Großen und Ganzen sehr ähnliche Ergebnisse. Im Gegensatz dazu ist der Gesamteindruck der KombiFiD-Daten für Ostdeutschland deutlich schlechter. Die Stichprobe ist hier zu klein und die Abweichungen der Ergebnisse zwischen Originaldaten und KombiFiD-Daten sind zu groß für eine sinnvolle Nutzung der KombiFiD-Daten für empirische Untersuchungen.

Schlüsselworte: KombiFiD, Firmendaten, Deutschland

This study tests whether the KombiFiD sample can be regarded as a high quality data set for empirical research on enterprises from manufacturing industries. It performs an empirical investigation using the original data in a first step and replicates exactly this investigation using the KombiFiD sample in a second step. For West Germany a comparison of the results based the original data and on the KombiFiD sample points to by and large highly similar results. Contrary to this the big picture is not in favour of the quality of the KombiFiD sample for East Germany where the KombiFiD sample is too small and differences between the results based on this sample and the original data are too large to suggest the use of the KombiFiD data in empirical investigations.

Keywords: KombiFiD, firm level data, Germany

JEL classification: C81

* This paper is part of the project *KombiFiD – Kombinierte Firmendaten für Deutschland* that is financially supported by the German Ministry for Education and Research (BMBF). It is a joint project of the Institute of Economics of Leuphana University Lueneburg, the research data centres of the German Federal Statistical Office and the statistical offices of the German federal states, the Institute of Employment Research of the Federal Employment Agency and the research department of the German Central Bank. While members of the KombiFiD-team from all institutions contributed to the construction of the data sets used in this paper I alone are responsible for the quality study presented here and the conclusions drawn.

** Leuphana University Lueneburg, and IZA, Bonn, E-Mail: wagner@leuphana.de

1. Motivation

Micro data at the level of the firm – the establishment (local production unit) or the enterprise (legal unit) – are an indispensable tool for empirical research in a wide range of economic fields including industrial economics, labour economics and international economics. In Germany most high-quality firm level data are collected in surveys conducted by the statistical offices. The German Federal Statistical Office and the statistical offices of the German federal states opened research data centres (described in detail in Zühlke et al. 2004) in 2001 and 2002. This started a new era for researchers working in empirical economics. Access to confidential data for firms that were collected in surveys performed by the statistical offices became easy by using these research data centres (RDC). The number and variety of data sets provided by the RDC increased steadily (see Kaiser and Wagner (2008) for an overview), and so did the use of it by researchers. The high potential of these data as a basis to generate new stylized facts, to motivate assumptions used in formal theoretical models, to test theoretical hypotheses econometrically, and to be used in policy consultation and evaluation is documented in a large and growing number of publications.¹

From their start the RDC offered access to micro level panel data that linked information from various waves of a survey over time. These panel data enormously extended the research potential of data from official statistics by allowing dynamic analyses and control for unobserved heterogeneity via panel econometric methods. Compared to this first generation of firm panel data sets, a second generation of data sets which became available recently has an even higher research potential. These new data combine information for firms gathered in different surveys that could not be analyzed jointly before. Merging firm level data from different surveys to construct data sets that cover information on a wider range of variables than the ones collected in any of these surveys, one at a time, is the basic idea of the project *AFID* which is in detail described in Malchin and Voshage (2009). *AFID* is an acronym for the German Amtliche Firmendaten für Deutschland (official firm data for Germany). Merging of firm data from different sources of official statistics is legal according to §13a

¹ For partial surveys, see Wagner (2006, 2008).

BStatG (Bundesstatistikgesetz, or federal statistics law), and it is technically feasible because an identical firm identifier is used in the different surveys. Furthermore, it is legal to add firm level data from other sources (e.g. from data bases offered by commercial providers of firm level information) to the data from official statistics provided that these data are publicly available (see Wagner 2010a).

The latest generation of firm panel data that includes information from various surveys conducted by the statistical offices over time and firm level information from external publicly available sources offers rich potential for empirical research. The information provided in these data sets, however, is still far from complete. To mention only two important points in these data sets there is no information available on foreign direct investment (FDI) of the firms and on the structure of the employees with regard to age, level of qualification etc. This information is available from data sets prepared by other data producers – FDI data at the firm level are offered by the German central bank and detailed information on the employees in a firm are offered by the Institute for Employment Research (IAB) of the Federal Employment Agency. Obviously merging firm level data from various producers would increase the value of the data enormously.

Linking confidential firm level information across the borders of the data producers, however, is difficult. Details aside, it is technically not easy (but not impossible either) and it is legal only if the firm agreed in written form. The basic idea of the project *KombiFiD* (an acronym that stands for *Kombinierte Firmendaten für Deutschland*, or combined firm level data for Germany) that is in detail described on the web (see www.kombifid.de) is to ask a large sample of firms from all parts of the German economy to agree to match confidential micro data for these firms that are kept separately by these three data producers in one data set. These matched data will then be made available for scientific research while strictly obeying the data protection law, i.e. without revealing micro level information to researchers outside the data producing agencies. In KombiFiD 54,960 firms were asked to agree in written form to merge firm level information kept inside the statistical offices, the IAB and the German central bank. 30,944 firms replied and 16,571 agreed. These 16,571 firms are in the

KombiFiD Agreement Sample. This data set is used here, and the term KombiFiD sample is used for it.

While the firm level data from the three data producing institutions are high quality data that are either a census of the respective population of firms or a representative sample of this population the KombiFiD sample is the result of self-selection of firms into this data set because participation in KombiFiD was voluntary. A crucial question is whether the KombiFiD sample can be regarded as a high quality data set that can be used as a solid basis for empirical research. One way to shed light on this² is to perform an empirical investigation using data for all firms available from the respective data producer (the original data) in a first step and to replicate exactly this investigation using the KombiFiD sample in a second step. This is done in this paper using data for enterprises from manufacturing industries.

2. Exports and firm characteristics in German manufacturing industries

In a recent paper Wagner (2010b) reports results of a comprehensive empirical study on the links between firm characteristics and export performance. This study uses firm level data from the AFID panel industry enterprises (see Malchin and Voshage 2009) provided by the RDC of the statistical offices of the German federal states. All variables used in this study are available in the KombiFiD sample for the firms from manufacturing industries.³ The basic idea explored here is to replicate the study from Wagner (2010b) using the KombiFiD sample made of all firms that agreed to the matching of their data across the boundaries of the data producers and to compare the results to shed light on the question whether the KombiFiD data are a reliable basis for empirical investigations for manufacturing enterprises.⁴

Table 1 indicates that about one third of the enterprises that are covered by the original data set can be found in the KombiFiD sample. For East Germany, this results in a fairly small sample. Given that even today a separate analysis of enterprises from East and West Germany is necessary

² An alternative way is to compare means and correlations of variables from the original data and the KombiFiD sample. Note that it is illegal to pool the original data and the KombiFiD sample. Therefore, a direct comparison of both data sets and an investigation of non-respondents or firms that refused to agree to merge their data are not feasible.

³ This statement is not exactly true. The information on the number of employees in a firm used in Wagner (2010b) is computed from the number of employees reported in the monthly survey of establishments in manufacturing. This information is not available in the KombiFiD sample. The number of employees reported in the cost structure survey is used instead. The correlation between these two variables is +0.9954 in 2003, indicating that both variables are nearly identical. Although the correlation is nearly perfect all computations were performed here with the new variable for the number of employees for both the original data and the KombiFiD sample. This explains the small differences between some of the results based on the original data reported in Wagner (2010b) and in the replication study here.

⁴ The focus of this paper is on the quality of the data from the KombiFiD sample. Therefore, neither the theoretical background of the empirical models estimated nor the economic conclusions drawn from the results are discussed; see Wagner (2010b) for economic flesh to the bones.

due to large differences in the economic performance in both parts of Germany this might cast doubts on the usefulness of the KombiFiD sample for analyses of manufacturing firms from East Germany.

Furthermore, Table 1 demonstrates that firms that never exported (over the four years investigated in the study) are underrepresented in the KombiFiD sample while firms that exported every year are oversampled. These differences are larger for East Germany than for West Germany.

Table 2 reports the distribution of characteristics of exporters and non-exporters from both parts of Germany in the original data set and in the KombiFiD sample in 2003, the first year of the study. The distributions are fairly similar⁵ in the original data and in the KombiFiD sample. Note, however, that the average number of employees in the firms tends to be somewhat larger in the KombiFiD sample. This fits with the observation mentioned above that the share of firms that exported in every year (in no year) is larger (smaller) in the KombiFiD sample than in the original data.

A comparison of the firm characteristics among exporters and non-exporters based on the original data and on the KombiFiD sample leads to identical conclusions when the distributions of characteristics in both groups of firms are compared using a Kolmogorov-Smirnov test for first-order stochastic dominance (see Table 3): Exporters are larger, employ more physical capital per employee, pay higher wages per employee and spend a higher share of total sales for R&D expenditures than non-exporters in both parts of Germany.

By and large, empirical models for the determinants of participation of firms in the export market lead to identical results when estimated with the original data or with the KombiFiD sample. The one exception is the estimated coefficient for the physical capital per employee. As can be seen from Table 4 based on the original data the physical capital intensity is unrelated to the probability of exporting for firms from West Germany, while the estimated coefficient is statistically highly significant when the KombiFiD sample is used. Note, however, that the physical capital per employee is not computed from information collected in the survey by the statistical office directly. Instead it is estimated from information on the amount of depreciation reported by the firms, information on the

⁵ Note that it is not possible to test for the equality of distribution across samples because it is illegal to pool data from the original sample and the KombiFiD sample.

composition of the capital stock into buildings and equipments at the industry level and information on the economic lives of buildings and equipments for the economy as a whole (for details see Wagner 2010c). Therefore, the quality of the capital intensity variable itself is doubtful, and the different results based on the original data and the KombiFiD sample should not be viewed as a convincing argument against the quality of the KombiFiD sample (see Table 4).

Table 5 demonstrates that similar conclusions hold for empirical models for the share of exports in total sales. Results are rather similar for both the original data and the KombiFiD sample except for the estimated coefficients for physical capital per employee. The estimated coefficient for physical capital intensity is statistically highly significant when the original data are used, but not significant at any conventional error level when the KombiFiD data are used.

Using pooled data for the years 2003 to 2006 a decomposition of the overall variation of firm characteristics into variation between firms and variation within firms over time shows similar results for both data sets (see Table 6).

When fixed enterprise effects are included in the empirical models for export participation and the share of exports in total sales to control for time invariant unobserved firm specific characteristics (like the quality and the strategy of management) results for West Germany do not differ much between the two data sets (see Table 7). The only exception is the different sign for the coefficient estimated for the share of R&D expenditures in total sales in the two samples – this coefficient, however, is not statistically different from zero at a conventional error level in both cases. For East Germany, however, we get a completely different picture. Firm size is no longer statistically significant when the KombiFiD sample is used, and the wage per employee (the proxy variable for human capital intensity) is positively related to export participation at an error level of five percent while the estimated coefficient is insignificant with $p = 0.217$ when the model is estimated with the original data.

The bottom line, then, is that a comparison of the estimations using the original data and the KombiFiD sample points to highly similar results for West Germany (with the exception of the results related to the physical capital intensity). Contrary to this the big picture is not in favour of the quality of

the KombiFiD sample for East Germany where the KombiFiD sample is too small and differences between the results based on this sample and the original data are too large to suggest the use of the KombiFiD data in empirical investigations.

3. Conclusion

This paper shows that results from empirical investigations for enterprises from West German manufacturing industries based on the KombiFiD sample are very similar to results computed with the original data. Therefore, the KombiFiD sample can be regarded as a sound data base for empirical studies on West German firms from manufacturing industries. Further research is needed to investigate whether this holds for other data from other parts of the economy (service industries, trade, buildings and construction), too.

| | p99 | 0 | 1107 | 640,933.1 | 46,278.13 | 10.03 |

Note: sd is the standard deviation; p1 is the first percentile, etc. The mimima and maxima are confidential because they are information for single enterprises.

Table 3: Differences between exporters and non-exporters: Distributions of characteristics in 2003

| | West Germany Original data | KombiFiD data- Agreement sam. | East Germany Original data | KombiFiData Agreement sam. |
|---|-------------------------------|----------------------------------|-------------------------------|-------------------------------|
| Number of employees | | | | |
| K-S-Test H0: equality of distributions (p-value) | 0.000 | 0.000 | 0.000 | 0.000 |
| K-S-Test H0: differences favourable for non-exporters (p-value) | 0.000 | 0.000 | 0.000 | 0.000 |
| K-S-Test H0: differences favourable for exporters (p-value) | 1.000 | 1.000 | 1.000 | 1.000 |
| Physical capital per employee (€) | | | | |
| K-S-Test H0: equality of distributions (p-value) | 0.000 | 0.000 | 0.000 | 0.000 |
| K-S-Test H0: differences favourable for non-exporters (p-value) | 0.000 | 0.000 | 0.000 | 0.000 |
| K-S-Test H0: differences favourable for exporters (p-value) | 0.898 | 0.817 | 0.994 | 0.994 |
| Wage per employee per year (€) | | | | |
| K-S-Test H0: equality of distributions (p-value) | 0.000 | 0.000 | 0.000 | 0.000 |
| K-S-Test H0: differences favourable for non-exporters (p-value) | 0.000 | 0.000 | 0.000 | 0.000 |
| K-S-Test H0: differences favourable for exporters (p-value) | 0.969 | 0.967 | 0.997 | 0.920 |
| Share of R&D expenditures in total sales (percent) | | | | |
| K-S-Test H0: equality of distributions (p-value) | 0.000 | 0.000 | 0.000 | 0.000 |
| K-S-Test H0: differences favourable for non-exporters (p-value) | 0.000 | 0.000 | 0.000 | 0.000 |
| K-S-Test H0: differences favourable for exporters (p-value) | 1.000 | 1.000 | 1.000 | 1.000 |

Note: K-S-Test is the Kolmogorov-Smirnov test for first-order stochastic dominance.

Table 4: Determinants of export participation: Probit-estimates

| | West Germany Original data | | KombiFiD data- Agreement sam. | East Germany Original data | KombiFiData Agreement sam. |
|---|-------------------------------|-----------|----------------------------------|-------------------------------|-------------------------------|
| Number of employees | β | 0.00015 | 0.00015 | 0.00044 | 0.00068 |
| | p | 0.000 | 0.000 | 0.000 | 0.003 |
| Number of employees (squared) | β | -9.27e-10 | -9.17e-10 | -5.62e-8 | -7.74e-8 |
| | p | 0.000 | 0.000 | 0.001 | 0.004 |
| Physical capital Per employee (€) | β | -4.32e-8 | -1.53e-7 | 1.70e-9 | 1.19e-7 |
| | p | 0.387 | 0.010 | 0.979 | 0.612 |
| Wage per employee per year (€) | β | 5.86e-6 | 5.13e-6 | 7.06e-6 | 1.48e-5 |
| | p | 0.000 | 0.000 | 0.001 | 0.002 |
| Share of R&D expend. in total sales (%) | β | 0.012 | 0.015 | 0.039 | 0.017 |
| | p | 0.009 | 0.024 | 0.000 | 0.091 |
| Number of cases | | 9,410 | 3,294 | 1,597 | 448 |

Note: β is the estimated marginal effect at the mean of the independent variable; p is the prob-value. All models include a full set of 4digit industry-dummies plus a constant. The models are estimated for data from 2005.

Table 5: Determinants of the share of exports in total sales: Fractional logit estimates

| | West Germany – 2003 | | West Germany - 2004 | | |
|---|------------------------|--|---------------------|--------------------|--------------------|
| | Original data | | KombiFiD data | Original data | |
| | | | Agreement sample | | Agreement sam. |
| Number of employees | β 0.000083 p 0.000 | | 0.000064 0.003 | 0.000081 0.000 | 0.000061 0.004 |
| Number of employees (squared) | β -5.39e-10 p 0.000 | | -3.92e-10 0.004 | -5.15e-10 0.000 | -3.57e-10 0.006 |
| Physical capital per employee (€) | β 6.56e-7 p 0.001 | | 3.18e-7 0.251 | 6.95e-7 0.000 | 2.76e-7 0.274 |
| Wage per employee per year (€) | β 0.000030 p 0.000 | | 0.000027 0.000 | 0.000032 0.000 | 0.000037 0.000 |
| Share of R&D expend. in total sales (%) | β 0.057 p 0.000 | | 0.058 0.000 | 0.052 0.000 | 0.035 0.083 |
| Number of cases | 10,038 | | 3,987 | 10,038 | 3,987 |

Note: β is the estimated regression coefficient; p is the prob-value. All models include a full set of 4digit industry-dummy variables plus a constant. The model cannot be estimated for East Germany; Stata reports that the variance matrix is non-symmetric or highly singular.

Table 6: Decomposition of overall variation into between and within variation

| | | West Germany | | East Germany | |
|--|---------|---------------|------------------------------|---------------|------------------------------|
| | | Original data | KombiFiD data-Agreement sam. | Original data | KombiFiD data-Agreement sam. |
| Exporter (Dummy; 1 = yes) | overall | 0.39 | 0.37 | 0.48 | 0.46 |
| | between | 0.38 | 0.36 | 0.46 | 0.44 |
| | within | 0.10 | 0.10 | 0.15 | 0.13 |
| Share of exports in total sales | overall | 26.10 | 26.17 | 23.87 | 24.64 |
| | between | 25.67 | 25.76 | 23.18 | 24.02 |
| | within | 4.72 | 4.64 | 5.71 | 5.57 |
| Number of employees | overall | 2,645.94 | 3,705.38 | 467.40 | 516.61 |
| | between | 2,642.66 | 3,700.91 | 465.37 | 515.09 |
| | within | 133.69 | 188.87 | 44.51 | 43.13 |

| Number of observations | 840 | 236 | 7,408 | 2,736 |
| Number of firms | 210 | 59 | 1,852 | 684 |

Note: β is the estimated regression coefficient; p is the prob-value. All models include a full set of year-dummies; the fractional probit panel models include a full set of mean values of the exogenous variables plus a constant, too.

Bisher sind in der Reihe folgende FDZ-Arbeitspapiere erschienen:

Arbeitspapier Nr. 41: How to define an enterprise and assign trade declarations to the right one: Exploration of German traders' micro transaction data, C. Stirböck, August 2011

Arbeitspapier Nr. 40: Definition von nutzerseitigen Kriterien für Datenstrukterfiles, J. Höninger/ M. Rosemann/ R. Voshage, Juli 2011

Arbeitspapier Nr. 39: Improvement of data access. The long way to remote data access in Germany, M. Brandt/ M. Zwick, Juni 2011

Arbeitspapier Nr. 38: Decentralised Access to Confidential Microdata in Europe, M. Brandt/ M. Zwick, Juni 2011

Arbeitspapier Nr. 37: Masking Micro Data with Stochastic Noise, J. Höhne/ J. Höninger, Mai 2011

Arbeitspapier Nr. 36: Enthüllungsrisiko beim Remote Access: Die Schwerpunkteigenschaft der Regressionsgerade, A. Vogel, April 2011

Arbeitspapier Nr. 35: Temporary agency work and firm performance, S. Nielen/ A. Schiersch, April 2011

Arbeitspapier Nr. 34: Harmonisation of statistical confidentiality in the Federal Republic of Germany, M. Brandt/ A. Crößmann/ C. Gürke, März 2011

Arbeitspapier Nr. 33: Remote Access. Eine Welt ohne Mikrodaten ??., G. Ronning/ P. Bleninger/ J. Drechsler/C. Gürke, Januar 2011

Arbeitspapier Nr. 32: Compiling a Harmonized Database from Germany's 1978 to 2003 Sample Surveys of Income and Expenditure., T. Bönke/ C. Schröder/ C. Werdt, Mai 2010

Arbeitspapier Nr. 31: The Research Potential of New Types of Enterprise Data based on Surveys from Official Statistics in Germany., J. Wagner, Oktober 2009

Arbeitspapier Nr. 30: Geschlechterspezifische Einkommensunterschiede bei Selbstständigen im Vergleich zu abhängig Beschäftigten - Ein empirischer Vergleich auf der Grundlage steuerstatistischer Mikrodaten, P. Eilsberger/ M. Zwick, Januar 2008

Arbeitspapier Nr. 29: Reichtum in Niedersachsen und anderen Bundesländern - Ergebnisse der Steuergeschäftsstatistik 2003 für Selbstständige (Freie Berufe und Unternehmer) und abhängig Beschäftigte, P. Böhm/J. Merz, November 2008

Arbeitspapier Nr. 28: Exports and Productivity in the German Business Services Sector. First Evidence from the Turnover Tax Statistics Panel, A. Vogel, Juli 2009

Arbeitspapier Nr. 27: Künstler in den Daten der amtlichen Statistik, C. Haak, August 2008

Arbeitspapier Nr. 26: Union Density and Varieties of Coverage: The Anatomy of Union Wage Effects in Germany, B. Fitzenberger/ K. Kohn/ A. C. Lembcke, August 2008

Arbeitspapier Nr. 25: German engineering firms during the 1990's. How efficient are export champions?, A. Schiersch, Juli 2008

Arbeitspapier Nr. 24: Zum Einkommensreichtum Älterer in Deutschland – Neue Reichtumskennzahlen und Ergebnisse aus der Lohn- und Einkommensteuerstatistik (FAST 2001), P. Böhm/ J. Merz, Februar 2008

Arbeitspapier Nr. 23: Neue Datenangebote in den Forschungsdatenzentren. Betriebs- und Unternehmensdaten im Längsschnitt, M. Brandt/ D. Oberschachtsiek/ R. Pohl, November 2007

Arbeitspapier Nr. 22: Stichprobendaten von Versicherten der gesetzlichen Krankenversicherung-Grundlage und Struktur des Datenmaterials, P. Lugert, Dezember 2007

Arbeitspapier Nr. 21: KombiFiD - Kombinierte Firmendaten für Deutschland, S. Bender/ J. Wagner/ M. Zwick, November 2007

Arbeitspapier Nr. 20: Neue Möglichkeiten zur Nutzung vertraulicher amtlicher Personen- und Firmendaten, U. Kaiser/ J. Wagner, Juni 2007

Arbeitspapier Nr. 18: Die Gehalts- und Lohnstrukturerhebung: Methodik, Datenzugang und Forschungspotential, H.-P. Hafner/ R. Lenz, Mai 2007

Arbeitspapier Nr. 17: Anonymisation of Linked Employer Employee Datasets. Theoretical Thoughts and an Application to the German Structure of Earnings Survey, H.-P. Hafner/ R. Lenz, Dezember 2006

Arbeitspapier Nr. 16: Die europäische Union - Integration von unten oder Eliteprojekt? Eine Sekundäranalyse von Mikrodaten der amtlichen Statistik, R. Nauenburg, November 2006

Arbeitspapier Nr. 15: Keeping in Touch - A Benefit of Public Holidays Using German Time Use diary Data, J. Merz/ L. Osberg, November 2006

Arbeitspapier Nr. 14: Zur Konzeption eines Taxpayer-Panels für Deutschland, D. Vorgrimler/C. Gräß/ S. Kriete-Dodds, November 2006

Arbeitspapier Nr. 13: Anonymisierte Daten der amtlichen Steuerstatistik, D. Vorgrimler, September 2006

Arbeitspapier Nr. 12: Mikrosimulation in der Betriebswirtschaftlichen Steuerlehre, R. Maiterth, August 2006

Arbeitspapier Nr. 11: Der Anteil der freien Berufe und der Gewerbetreibenden an der Gemeindefinanzierung, M. Zwick, September 2006

Arbeitspapier Nr. 10: Konstruktion und Bewertung eines ökonomischen Einkommens aus der faktisch Anonymisierten Lohn- und Einkommensteuerstatistik, T. Bönke/F. Neher/C. Schröder, August 2006

Arbeitspapier Nr. 9: Anonymising business micro data - results of a German project, R. Lenz/ M. Rosemann/D. Vorgrimler/R. Sturm, Juni 2006

Arbeitspapier Nr. 8: Scientific analyses using the Continuing Vocational Training Survey 2000, R. Lenz/ H.-P. Hafner/ D. Schmidt, Juni 2006

Arbeitspapier Nr. 7: A standard for the release of microdata, R. Lenz/ D. Vorgrimler/ M. Scheffler, Juni 2006

Arbeitspapier Nr. 6: Measuring the disclosure protection of micro aggregated business microdata,
R. Lenz, Juni 2006

Arbeitspapier Nr. 5: De facto anonymised microdata file on income tax statistics 1998, J. Merz/
D. Vorgrimler/ M. Zwick, Oktober 2005

Arbeitspapier Nr. 4: Matching German turnover tax statistics, R. Lenz/ D. Vorgrimler, Juni 2005

Arbeitspapier Nr. 3: The research data centres of the Federal Statistical Office and the statistical offices of the Länder, S. Zühlke/ M. Zwick/ S. Scharnhorst/ T. Wende, März 2005

Arbeitspapier Nr. 2: Eine kommunale Einkommen- und Körperschaftsteuer als Alternative zur deutschen Gewerbesteuer: Eine empirische Analyse für ausgewählte Gemeinden, R. Maiterth/ M. Zwick, April 2005

Arbeitspapier Nr. 1: Ein Vergleich der Ergebnisse von Mikrosimulationen mit denen von Gruppensimulationen auf Basis der Einkommensteuerstatistik, H. Müller, März 2005

Stand: 14.11.2011
